SUMMARY

Themesoft's Pega Senior Developer opening lines up with the architecture, review, and mentorship work I have been doing across recent engagements. At Kacha Inc I run a structured plan-review-implementation-review cycle where every architectural decision and every piece of code is scored against a documented rubric and iterated until it clears a defined quality bar before it ships, the same discipline that design reviews and guardrail compliance assessments require. At the Redfish Beach Equipment Rental Platform I own the end-to-end architecture of a Node.js and MongoDB system, enforcing engineering guardrails such as a file-size ceiling, no duplicated logic, and defense-in-depth validation across frontend, API, and database layers, alongside a role-based permission model governing read, write, and admin access. At Gryphus Trading I built the firm's C++ trading infrastructure end to end, independently caught and corrected an incorrect fix a vendor had proposed after verifying it against the SDK reference, and hardened the system for the reliability, security, and performance a production trading environment demands. Through Ivy Kode I have provided technical direction and one-on-one mentorship to students and professionals across Python, C++, and Java, and I am ready to bring that same architectural rigor, review discipline, and technical leadership to a senior developer role.

SKILLS

- Application Architecture & Technical Design
- Code & Design Review Leadership
- Guardrail & Engineering Standards Compliance
- Technical Mentorship
- Scalability & Performance Engineering
- Security & Access Control
- Cross-Functional Technical Leadership
- Governance & Stakeholder Reporting

EXPERIENCE

AI Consultant | Kacha Inc

August 2023 – Present

Atlanta, Ga

- Directed a structured plan-review-implementation-review cycle in which every architectural decision and code change is scored against a rubric and iterated until it clears a defined quality bar before shipping.
- Provided technical direction and mentorship across a distributed team, documenting architecture decisions and implementation rationale in a persistent knowledge base for traceability.
- Established full-stack implementation discipline covering modularization, migration safety, and backward compatibility, serving as a governance layer equivalent to guardrail compliance review.

Software Consultant | Ivy Kode

2019 – 2025

Atlanta, Ga

- Provided technical direction and one-on-one mentorship to students and professionals across Python, C++, and Java, guiding them through debugging and design decisions.
- Advised clients on architecture and requirements, frequently identifying that the request as stated did not match the underlying problem, and redirected the design accordingly.
- Brought consistent technical leadership and problem-solving methodology across a wide range of stacks and domains, adapting review and design practices to each engagement's standards.

Software Developer | 21st Century Realty

October 2017 – May 2020

Austell, Ga

- Owned end-to-end architecture and technical design of the Redfish platform's product, checkout, and permissions layers, built on Node.js, Express, and MongoDB.
- Enforced engineering guardrails, including a file-size ceiling, elimination of duplicated logic, and defense-in-depth validation across frontend, API, and database layers, to protect scalability and reliability.
- Designed a role-based permission model with configurable groups and per-user overrides governing read, write, and admin access, and built repair tooling that reconciled stored financial data against canonical calculations.

Head Systems Engineer | Gryphus Trading

December 2015 – August 2019

New York, New York

- Led end-to-end architecture and technical design of the firm's trading infrastructure, integrating a third-party FIX engine with CME's production systems under strict security and reliability requirements.
- Conducted independent code review of a vendor-proposed fix, identified it was incorrect against the SDK reference, and corrected the implementation before it reached production.
- Hardened the system for scalability, reliability, and performance by resolving low-level concurrency, data-normalization, and network issues that could otherwise halt trading.

EDUCATION

Bachelor's Degree, Computer Science | Columbia University, New York, New York

August 2012 – May 2016
